Write a blog about objects and its internal representation in Javascript

Objects are important data types in javascript. Objects are different than primitive datatypes (i.e. number, string, boolean, etc.). Primitive data types contain one value but Objects can hold many values in form of Key: value pair. These keys can be variables or functions and are called properties and methods, respectively, in the context of an object.

Every object has some property associated with some value. These values can be accessed using these properties associated with them.

```
var myCar = new Object();
```

```
myCar.make = 'Suzuki';
```

```
myCar.model = 'Altros';
```

```
myCar.year = 1978;
```

```
myCar.wheels = 2;
```

After creating myCar object, the value inside the object can be accessed using keys.

i.e.

myCar.year

Output: 1978

These values can be accessed using brackets notation also.

myCar.year

Output: 1978
